Clifford theory for semisimple Hopf algebras

Sebastian Burciu (Institute of Mathematics "Simion Stoilow" of the Romanian Academy, Romania) smburciu@syr.edu

The classical Clifford correspondence for normal subgroups is considered in the setting of semisimple Hopf algebras. We prove that this correspondence still holds if the extension determined by the normal Hopf subalgebra is cocentral. Other particular situations where Clifford theory also works will be discussed. This talk is based on the paper "Clifford theory for cocentral extensions" Israel J. Math, 181, 2011, (1), 111-123 and some work in progress of the author.

Clifford correspondence for normal Hopf algebras The case of the stabilizer Z_{α}

On the dimension of the stabilizer (B, '11)

Let $B \subset A$ a normal extension of semisimple Hopf algebras. With the above notations:

ヘロト 人間 ト ヘヨト ヘヨト

Clifford correspondence for normal Hopf algebras The case of the stabilizer Z_{α}

On the dimension of the stabilizer (B, '11)

Let $B \subset A$ a normal extension of semisimple Hopf algebras. With the above notations:

•
$$|Z_{\alpha}| \leq \frac{|A|\alpha(1)^2}{b_i(1)}$$
 where \mathcal{B}_i is the equivalence class of α .

Clifford correspondence for normal Hopf algebras The case of the stabilizer Z_{α}

On the dimension of the stabilizer (B, '11)

Let $B \subset A$ a normal extension of semisimple Hopf algebras. With the above notations:

•
$$|Z_{\alpha}| \leq \frac{|A|\alpha(1)^2}{b_i(1)}$$
 where \mathcal{B}_i is the equivalence class of α .

2 Equality holds if and only if Z_{α} is a stabilizer in the sense of Rieffel, see [4].

Clifford correspondence for normal Hopf algebras The case of the stabilizer Z_{α}

On the dimension of the stabilizer (B, '11)

Let $B \subset A$ a normal extension of semisimple Hopf algebras. With the above notations:

•
$$|Z_{\alpha}| \leq \frac{|A|\alpha(1)^2}{b_i(1)}$$
 where \mathcal{B}_i is the equivalence class of α .

2 Equality holds if and only if Z_{α} is a stabilizer in the sense of Rieffel, see [4].

Clifford correspondence for normal Hopf algebras

Theorem (B, '11)

Clifford correspondence holds for Z_{α} if and only if one has equality in the previous inequality.

Sebastian Burciu Clifford theory for semisimple Hopf algebras

ヘロト 人間 ト ヘヨト ヘヨト

Clifford correspondence for normal Hopf algebras

Theorem (B, '11)

Clifford correspondence holds for Z_{α} if and only if one has equality in the previous inequality.

Corrolary (B, 11'.)

Clifford theory works for the stabilizer Z_{α} if and only if this is a stabilizer in Rieffel's sense.

Clifford correspondence for normal Hopf algebras

Theorem (B, '11)

Clifford correspondence holds for Z_{α} if and only if one has equality in the previous inequality.

Corrolary (B, 11'.)

Clifford theory works for the stabilizer Z_{α} if and only if this is a stabilizer in Rieffel's sense.

Clifford correspondence for normal Hopf algebras

Theorem (B, '11)

Clifford correspondence holds for Z_{α} if and only if one has equality in the previous inequality.

Corrolary (B, 11'.)

Clifford theory works for the stabilizer Z_{α} if and only if this is a stabilizer in Rieffel's sense.

Clifford correspondence for normal Hopf algebras The case when the stabilizer is a Hopf subalgebra

Back to the group case

If A = kG and B = kN for a normal subgroup N then the above inequality is equality.

ヘロト 人間 ト ヘヨト ヘヨト

Clifford correspondence for normal Hopf algebras The case when the stabilizer is a Hopf subalgebra

Back to the group case

If A = kG and B = kN for a normal subgroup N then the above inequality is equality. It states that the number of conjugate modules of α is the index of the stabilizer of α in G.

Clifford correspondence for normal Hopf algebras The case when the stabilizer is a Hopf subalgebra

Back to the group case

If A = kG and B = kN for a normal subgroup N then the above inequality is equality. It states that the number of conjugate modules of α is the index of the stabilizer of α in G. (Orbit formula)

A counterexample

A Counterexample

Exact factorization of groups

Let $\Sigma = FG$ be an an exact factorization of finite groups. This gives a right action $\lhd : G \times F \rightarrow G$ of F on the set G, and a left action $\triangleright : G \times F \rightarrow F$ of G on the set F subject to the following two conditions:

$$s \triangleright xy = (s \triangleright x)((s \triangleleft x) \triangleright y)$$
 $st \triangleleft x = (s \triangleleft (t \triangleright x))(t \triangleleft x)$

The actions \triangleright and \triangleleft are determined by the relations $gx = (g \triangleright x)(g \triangleleft x)$ for all $x \in F$, $g \in G$. Note that $1 \triangleright x = x$ and $s \triangleleft 1 = s$.
